Monitoring proves quality performance of SolarPeak systems

A SolarPeak Dairy Solar water heating system that was installed in November last year is delivering excellent results

We recently completed a monitoring calibration on a 1 year old SolarPeak Dairy Solar system in Ashburton. The system comprises 2 x 700 litre dairy solar cylinders and 4 x 30 tube collectors using a unique hydraulic design by Glenn Harvey of SolarPeak.

In just 6 days, half a megawatt was produced. This is equal to 7000 litres of water heated from 15 Celsius to 85 Celsius.

This SolarPeak design is without doubt perfect for any large hot water requirements.

We installed this 120 tube system to a 1200 litre open vented dairy cylinder last week. The design is simple, it is working well. 2 day install.
